## 1.2.2 Pyroelectric Energy Sensors

## 1µJ to 10mJ

## Features

- Ø12mm apertures
- Repetition rates up to 25,000Hz
- High sensitivity sensors
- Pulse widths up to 5ms

PE10BF-C

0.193, 0.248, 0.355, 0.532, 1.064

0.2-3µm ±2%, 10.6µm ±5%

Note: (a) Calibrated curve is checked and adjusted at the following wavelengths (µm) For other wavelengths in the curve there is additional calibration error as stated.

240 - 800nm add  $\pm4\%,$  2-3µm add  $\pm8\%,$  10.6µm add  $\pm15\%.$  <240nm not calibrated

calibration error as stated. <240nm not calibrated Note: (b) For wavelengths below 600nm, derate damage threshold to 60% of given values. Below 300nm, derate to 40% of given values. Note: (c) For >7% of full scale, with the "user threshold" setting set to minimum. For other settings, the spec is for >7% of full scale or greater than twice the "user threshold", whichever is greater. The user threshold is not available with LaserStar, Nova/Drion, Pulsar, USBI and Quasar. For these meters, the threshold is set to minimum and the linearity spec is >10% of full scale. The PE-C series will only operate with Nova or Orion meters with an additional adapter Ophir P/NT 208272 (see page 105). The adapter can introduce up to 1% additional measurement error. The user threshold feature allows adjustment of the internal threshold up to 25% of full scale if desired to avoid false triggering in noisy environments. For further information, see the FAQs on our Website. Note: (d) The absorption at 675nm is approximately the same as at 10.6µm. Therefore, to measure a CO<sub>2</sub> laser, set to the 675nm setting. The additional error for measuring 10.6µm is ±5%. Note: (e) With the LaserStar, Pulsar, USBI, Quasar and Nova/Orion with adapter, for the PE10-C model the 1µs pulse width setting is displayed as "10µs".
